SERIES P8511-000-R

Single Axis Position Controller
for switched positioning

- Integrated relay outputs
- Integrated power pack (115/230 VAC)
- Single set operation
- Up to three different speeds
- Manual (inching) operation
- Extensive functions and parameters

1. Short Description

The P8511-000-R is a modern and compact solution for single axis tasks. An extensive function pool allows to modulate the controller for individual applications:

- Three speed rates
- Absolute and incremental positioning modes
- Single set operation
- Manual operation
- Batch counter with completed output
- Pulse factor
- Datum setting routines
- Tool offset compensation in incremental mode
- Incremental error compensation
- Backlash compensation
- Tolerance window blanking
- Encoder monitoring
- Input frequency max. 20 kHz

The unit is suitable for operation with any type of 2 or 3 speed bi-directional drive or any variable speed drive with 1, 2 or 4 quadrant of control. The performance and accuracy obtained is dependent on the type of drive chosen. The outputs for stepped speed drives are relays. These outputs can be configured in a number of ways to suit all types of control circuits. The actual position is monitored by an incremental encoder. The power supply unit is integrated. The controller can be used to position machinery to any desired absolute position. Alternatively, the controller can be used to feed material through a process.

2. Functions

2.1 Two speed operation

NB: R1 = R2 > R3

The value in Register 1 must be the same value as Register 2
2.2 Three speed operation

NB: R1 > R2 > R3  The value in Register 1 must be larger than Register 2

NB: The stop offset is only effective when R8 = 1xxxxx.

2.3 Setting Datum

Datum can be set in a variety of ways. The method is selected in Register R8/3

R8 = xx0xxx  Datum to R7
Closing input St 3 / 4 transfers the value set in R7 into Actual Value Display

R8 = xx1xxx  Setting to Preset
Closing input St 3 / 4 transfers the Demand display value into Actual Value Display

R8 = xx2xxx  Automatic Datum setting - direction positive

R8 = xx3xxx  Automatic Datum setting - direction negative

R8 = xx4xxx  Datum with keypad alone
The value of R7 is transferred to Actual Display by accessing R7, typing in value and then pressing E.

2.4 Encoder Monitoring

If, after positioning is activated, no Encoder pulses are received after a time set in R19 (0.1 to 9.9 sec), positioning will be aborted and fault 01 will be displayed.
Setting R19 to 0.0 sec, disables this feature.
2.5 **Batch Counter**

Register R18/6 sets the method of counting whether adding or subtracting:

- \( R18 = \text{xxxxx1} \) Automatic subtracting
- \( R18 = \text{xxxxx2} \) Automatic adding
- \( R18 = \text{xxxxx3} \) Manual subtracting (external input signal)
- \( R18 = \text{xxxxx4} \) Manual adding (external input signal)
- \( R18 = \text{xxxxx5} \) Automatic add/subtract (Single only)
- \( R18 = \text{xxxxx6} \) Manual add/subtract (Single only)

With adding function, the counter starts from zero. When the set quantity is reached, the quantity complete output will be pulsed. With subtracting function, counting from preset to zero takes place. When zero is reached, the quantity complete output will be pulsed.

With add/subtract function, subtracting will take place if a preset value is entered. On reaching zero, adding will ensue. When the quantity counter goes from 1 to 0, a pulse output is given. The length of this pulse is set in P11. Setting 0.0 gives a maintained output.

2.6 **Error messages**

When a fault occurs, its number flashes in Actual Value Display:

- Fault number 01 = Encoder
- 02 = End Limit minimum
- 03 = End Limit maximum
- 04 = Actual Position < min software limit (R13) Hand
  Demand Position < min software limit (R13) Single
- 05 = Actual Position > max software limit (R14) Hand
  Demand Position > max software limit (R14) Single
- *07 = External stop activated or wire break

The fault message is cleared by pressing any button.
“07” also flashes if Stop on front panel is activated in middle of any move.

*NB:* External stop input must be linked before system can operate. Therefore, if external n/c pushbutton is not fitted, then insert a permanent wire link.
3. Front Panel

3.1 Functions of Display

- **Actual Position**: Shows the Actual Position of the axis.
- **Demand Position**: Here you can enter the required position (or Register value).
- **Quantity Window**: Shows how many pieces are left to be cut (or have been cut) or how many incremental moves yet to be completed.
- **LED “Hand”**: Illuminates when button “Select” is pressed.
- **LED “Single”**: Illuminates when button “Select” is pressed.
- **LED 1 - 2**: Indicate which input window is being used selected by button >.

3.2 Function of the Keypad

- **Select**: Selecting Single enables operator to enter a position Demand value. Pressing > enables quantity value to be entered. Pressing "Select" again enables Hand operation.
- **Start**: Start positioning action. Start is inactive in Register setting mode and Hand mode.
- **Stop**: Stops positioning action. Also clears error code. Stop is inactive in Register mode and Hand mode.
- **>**: Sequentially selects Dimension or Quantity window. In Register setting mode selects alternatively:- Register number and Register value.
- **C**: Clears the selected window to zero.
- **0-9**: Numerical Keypad for entry of values at all times.
4. **Controller in Operation**

Switch on conditions is programmable in register R33:

- \( R33 = \text{xxxxx0} \) same conditions as at time of switch off
- \( R33 = \text{xxxxx1} \) Single mode
- \( R33 = \text{xxxxx3} \) Hand mode

The Actual position is memorised. In “Hand” the demand window line is switched off. In “Single” the Demand value is memorised

### 4.1 Position to new value

- Press C : Clear demand position value
- Press 0-9 : To enter desired position
- Press > : Select quantity demand
- Press C : Clear quantity value
- Press 0-9 : To enter desired quantity
- Press > : To ensure correct window selected
- Press start : The axis moves to desired position

### 4.2 Manual operation

Use the button **Select** to select Hand (LED illuminates).
Use button 7 (forwards) & 9 (backwards) to move axis
The direction of rotation can be selected in P64
The buttons 7 & 9 have twin functions :

Initially the axis moves at slow speed. When the time set in P32 has elapsed, the axis changes into high speed. This condition continues till button is released.

In high speed, when the Actual position reaches preset software limits (P13 + P1) or (P14 - P1), the speed automatically drops to creep.
5. Setting of Registers

5.1 Register Input

Press F for 2 sec The digits in Actual value display flash.
98 is displayed when Registers are protected by security code.

To unlock Registers :-

Press > Select Demand window

Enter 250565 The security code

Thereafter, the required Register is displayed. To alter value of Register proceed as follows:-

Press > The Actual value display reads 01 for Register 1

Use keypad 0… 9 To enter desired Register number

Press > The value of that Register is displayed in Demand Window

Press C To clear old value

Use keypad 0… 9 To enter desired Register value

Press > The Register value is stored in memory. The Actual Value display indicates next Register number

A number of Registers may be set sequentially.

Press F for 2 sec The Register entry is ended. Actual position is again displayed

Registers without function cannot be accessed.

Once Registers have been unlocked, you may alternate between operation and Register entry mode without the need for further security code entry.

The Registers can be locked away, by either

Powering down, or

Selecting Register 98; press > ; press F for 2 sec.

* Logical sequence values such as these must always be present, regardless whether 3 speed, 2 speed or 1 speed drive is used.

**P1 > P2 > P3 for 3 speed drive**  **P1 = P2 > P3 for 2 speed or 1 speed drive.**
7. Description of Registers

R01  Slow speed distance forward/reverse or forward only (see R28/2)
    Distance at which the controller switches from high speed to slow speed. The output high
    speed will be switched off.

R02  Creep speed distance forward/reverse or forward only (see R28/2)
    Distance to demand position at which the controller switches from slow to creep speed

R03  Stop offset distance forward/reverse or forward only (see R28/2)
    The overrun distance can be programmed to compensate for distance from the switch-off
    point of the motor to standstill. For exact positioning, the overrun distance should be very
    small (0.0 to 0.5 mm). Therefore the mechanical friction should be steady and the creep
    speed should be very slow.
    During commissioning, first set R12 to zero (to eliminate Tolerance window blanking),
    then set the value of R03 to 0.0 and execute a number of moves in both directions. Note
    the average overrun distance and then set R03 to that value. Then set R12 to suit.

R04  Backlash overrun
    To correct for screw or pinion backlash, the Demand position should be approached from
    one direction only. In positive direction therefore, the Demand position will be overrun by
    the value of R4 and driven back at creep speed after a time delay of R10, to the Demand
    position.

R05  Retract distance
    There are different modes available in the P8511, selectable by Register R18/2.
    If R18/2 = 0  Retract Position = Actual + R5
    If R18/2 = 1  Retract Position = Value of R5
    Whilst the input St3/6 is held on, the slide will move to the “Retract” position. On release of
    input, slide will return to the original position. (Value 0)
    When input St3/6 is activated, the slide moves to position as set in R5 but will not return to
    original position on release of input. (Value 1)

R06  Tool offset compensation
    This Register can be accessed without Security Code. When moving in incremental, it is
    often the case that the subsequent function is a cut that removes part of the material.
    Thus to cut the correct preset lengths, it is necessary to move the demanded distance plus
    the “Tool Offset”. This feature is active in incremental mode.
R07  Datum
The Datum value is stored in this Register. The value is used in different ways, in accordance with setting of P8/3. Input St3/4 initiates loading. This Register can be accessed without Security Code.

R08  System Register 1
This Register sets the basic operating functions of the unit.

**Backlash**
0 = no backlash compensation  
1 = negative backlash comp  
2 = positive backlash comp  
3 = negative backlash on start in R24 window  
4 = positive backlash on start in R24 window

**Output Relay Configuration**
0 = 3 speed operation - Fast, Slow and Creep  
1 = 2 speed operation - Forwards & Backwards  
2 = 2 speed operation - Run & Reverse  
3 = Separate outputs - Fast & Slow forwards, Fast & Slow reverse.  
4 = 3 speed operation forwards - Reverse direction is Fast only.  
5 = 3 speed Binary coded - Forwards & Backwards  
6 = 3 speed operation - Forwards & Backwards

**Option**

**Datum**
0 = Datum to R7 with external pulse by key-switch  
1 = Datum to Demand position window with external key-switch  
2 = Automatic datum to positive direction limit  
3 = Automatic datum to negative direction limit  
4 = Datum to R7 by key-board only

**Kind of positioning**
0 = Analogue positioning  
1 = Fast/slow/stop
Relay Configurations

R2 = Run forwards. R5 = Run reverse
R09  **Time position reached**

During each move the controller gives an output to signal “positioning”. When 'in position' the output is deactivated for the length of this pulse set in R9. Setting 0.0 gives a maintained output. This output St5/1-2 is inactive when Actual position = Demand position +/- Tolerance window R12

R10  **Backlash dwell time**

When the machine stops at the end of the overrun, it is usually desirable to have a short delay. The time is set in this Register.

R11  **Pulse “Quantity complete”**

When the quantity counter goes from 1 to 0, a pulse output at St6/3-4 is given. The length of this pulse is set in R11. Setting 0.0 gives a maintained output.

R12  **Tolerance window**

It is possible to enter a value in register R12 that represents an acceptable tolerance e.g. 0.1 mm. When the actual position is within the Tolerance window, the actual position displayed is made equal to the target position. The actual error is not lost, as the controller knows the true position.

Example: R12 = 0.2  Therefore tolerance window is +/- 0.2mm

<table>
<thead>
<tr>
<th>Display without Tolerance set</th>
<th>Display with tolerance set</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actual Window</td>
<td>1998</td>
</tr>
<tr>
<td>Target Window</td>
<td>2000</td>
</tr>
</tbody>
</table>

R13/R14  **Min/Max software limits**

<table>
<thead>
<tr>
<th>Fault Message</th>
<th>Target &lt; Limit R13</th>
<th>Target &gt; Limit R14</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td></td>
<td></td>
</tr>
<tr>
<td>05</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Single set operation**
Immediately after start signal, the controller checks the software limits. If the Demand position is greater or smaller than the corresponding limit, the controller will stop and show the error message on the display. The backlash distance in R4 is considered at the check of the Max software limit, if the backlash is activated in R8/6.

**Manual operation (inching)**
The movement will stop when software limits are reached. If moving at high speed, the drive will drop to creep speed at a distance set in R1 from this limit. This prevents running into the ends of the machine. The end limit values are modified by backlash value as set in R4, if R8/6 is selected.

**R15 Software limit / end-switch limits adjustment**
Software limits (R13 & R14) are active in accordance with the setting of R15/6

- xxxx0 Both software limits active
- xxxx1 Min software limit (R13) inhibited
- xxxx2 Max software limit (R14) inhibited
- xxxx3 Both software limits (R13&R14) inhibited

External end-switches can be connected to the St4/3 negative direction and at St4/4 for positive direction.

- xxxx0x Both limits inputs active
- xxxx1x Min limit input (St4/3) inhibited
- xxxx2x Max limit input (St4/4) inhibited
- xxxx3x Both software limit inputs (St4/3 St4/4) inhibited

**N.B If these are not connected to limit switches they need to be connected ”normally closed” (i.e. linked out).**

**R17 Display Brightness**
Setting this parameter changes the brightness of the display.
0 = dark, and 15 = maximum brightness.
**R18 System Register 2**

This Register also sets the functions of the controller.

**Demand Window**

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
</tr>
</thead>
</table>

**Quantity Counter**
- 0 = no quantity counter
- 1 = automatic subtracting
- 2 = automatic adding
- 3 = manual subtracting (external input St3/7)
- 4 = manual adding (external input St3/7)
- 5 = automatic add/sub (in Single only)
- 6 = manual add/sub for (in Single only)
- 7 = automatic subtracting, STOP when “zero”
- 8 = manual subtracting, STOP when “zero”

**Option**

**Positioning in single**
- 0 = Absolute
- 1 = Incremental + ve
- 2 = Incremental – ve
- 3 = Incremental from zero
- 4 = Incremental from zero with saw-blade in negative

**Retract mode**
- 0 = retract to Actual + P5 return on deactivation
- 1 = retract to P5 setting return on deactivation
- 2 = retract whilst input active return on deactivation
- 3 = retract to Actual + P5 without return
- 4 = retract to P5 without return
- 5 = retract whilst time in R 10 in positive direction, no return
- 6 = retract to Actual –P5 in negative direction, return on deact.
- 7 = retract whilst time in R 10 in negative direction, return on deactivation.
- 8 = retract to Actual –P5 in negative direction, no return.
- 9 = retract whilst time in R 10 in negative direction, no return.

**Serial link**
- 0 = none
- 1 = with RS232
**R19  Encoder monitoring**
If after positioning is initiated, no Encoder pulses are sensed after a time set in R19, positioning will be aborted and Fault 01 will be displayed. Setting R19 to 0.0, disables Encoder pulse monitoring.

**R20  Decimal Point**
The decimal point is placed in a fixed position and is optional only. It does not change the resolution of the system. The position is dependent on setting of Register R97.

**With R97  = xxxx0 = mm mode**
R20  = xxxx0  = without
R20  = xxxx1  = 1/10
R20  = xxxx2  = 1/100
R20  = xxxx3  = 1/1000

**With R97  = xxxx1 = Inch mode 1/100**
Decimal point is fixed at 1/100

**With R97  = xxxx2 = Inch mode 1/1000**
Decimal point is fixed at 1/1000

**With R97  = xxxx3 = “Inch” factor freely programmable in R94**
R20 =xxxx0x  = without  R20 =xxxx1x  = 1/10
R20 =xxxx2x  = 1/100  R20 =xxxx3x  = 1/1000

**R21  Slow speed distance in negative direction**
This parameter is important for application with different load conditions on forward or backward if no use of automatic backlash compensation is desired. The Parameter R28/2 has to be set to 1 for activation. Distance at which the controller switches from high speed to slow speed in negative direction (the output high speed will be switched off).

**R22  Creep speed distance in negative direction**
Distance to demand position in negative direction can be set in this parameter at which the controller switches from slow to creep speed

**R23  Stop offset distance in negative direction**
The overrun distance in negative direction can be programmed in this parameter to compensate for distance from the switch-off point of the motor to standstill.

**R25  Home Position**
Activating the input St3/5 will send the Axis to a prefixed position as set in R25.
R28  System Register 3

This Register also sets the functions of the controller.

**Demand Window**

- **Display windows in single mode**
  1 = Demand Alone
  2 = All Windows in use

- **START/STOP button inhibit**
  0 = both activated
  1 = STOP disabled
  2 = START disabled
  3 = both disabled

- **START inhibit in the tolerance window**
  0 = Start in the tolerance window enabled
  1 = Start input in the tolerance window disabled

- **External STOP logic**
  0 = Stop is activated when input is at low level
  1 = Stop is activated when input is at high level

- **Separate slowdown parameter selection**
  0 = Slowdown in both direction set by R1, R2, R3
  1 = Slowdown forward R1, R2, R3, reverse R21, R22, R23

R29  Time Delay for Drive inhibit (Positioning)

On activating start, output St6/1-2 is activated. On arriving in position, after a time delay of R29 this output deactivates.

R32  Start delay time

When in Hand mode and the delay time set in this parameter has elapsed, the controller will move from slow speed to fast speed operation.

R33  Power on mode

This parameter sets the switch on conditions of the unit.
- R33 = xxxxx0 same conditions as at time of switch off
- R33 = xxxxx1 Single mode
- R33 = xxxxx3 Hand mode

The Actual position is memorised. In “Hand” the demand window line is switched off. In “Single” the Demand value is memorised.
R56  Multi edge triggering

1 = x 1  2 = x 2  4 = x 4
Entry of any other value will automatically select 1

R64  Direction of Manual Buttons

<table>
<thead>
<tr>
<th>Button</th>
<th>Setting 0</th>
<th>Setting 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Button 7</td>
<td>Backwards</td>
<td>Forwards</td>
</tr>
<tr>
<td>Button 9</td>
<td>Forwards</td>
<td>Backwards</td>
</tr>
</tbody>
</table>

R69  Speed of going to Datum in First phase, in switched speed control mode

Value xxxxx0 = creep speed to limit switch
Value xxxxx1 = slow speed to limit switch
Value xxxxx2 = Fast speed to limit switch
Approach to the maker pulse always in creep-speed.

R88  System Register 3

This Register sets further basic functions of the controller.

Demand Window

Incremental error comp
0 = not active
1 = active

Start input
0 = rising edge triggered
1 = falling edge triggered

R94  “Free” Factor

Any factor value can be entered here between 0.00001 and 9.99999 and selected by R97 = xxxxx3. When the display is switched between mm’s / inch, this factor will be used to change the display to secondary units.
R96 Encoder Pulse Multiplier
A factor (0.00001 to 9.9999) can be entered in this Register. The input pulses will be multiplied by this factor, to modulate the display to desired values. If no multiplication is required, this Register must be set to 1.00000

R97 Inch/mm conversion mode
The setting in this register activates the in inch mode, the free factor and the resolution in the inch mode can be selected. R97/6 =00000x

0 = mm operation
1 = inch operation. Resolution 1/100
2 = inch operation. Resolution 1/1000
3 = factor operation. As set in R94

R98 Security Code
Enter 250565 to unlock and change Parameters

R99 Service register
For testing at factory set-up only.
8. Functions of Inputs (Terminals ST3)

St3/1 **Terminal for pulling down signals to OV**  
(Pull up to +24v is an option – Factory fitted only)

St3/2 **External start input**  
The start is edge triggered. Rising or falling edge can be selected in R88/5

St3/3 **External stop input**  
The input logic for the STOP input can be selected in the system parameter R 28/3  
Value 0 = Input open = no positioning  
Value 1 = Input closed = no positioning.

St3/4 **Set Datum**  
When Register R8/3 is set to 0 or 1, Datum can be set by this input  
R8 = xx0xxx datum to Register 7  
R8 = xx1xxx datum to Demand value  
R8 = xx2xxx Start of datum sequence in positive direction  
R8 = xx3xxx Start of datum sequence in negative direction

St3/5 **Incremental Negative**  
Activating this input causes axis to move incrementally in direction –ve.  
This input has priority over setting of R18/3 and R18/4.

St3/6 **Retract**  
Activating this input causes the axis to move in accordance with setting of R18/2

St3/7 **Quantity adding/subtracting**  
Each pulse on this input will increment or decrement the counter depending on setting of R18/6 = value 1 - 6.

St3/8 **Incremental Positive**  
Activating this input causes axis to move incrementally in direction +ve.  
This input has priority over setting of R18/3.
9. Functions of Inputs (Terminals ST4)

St4/1  Terminal for pulling down signals to 0 V
(Pull up to +24v is an option – Factory fitted only)

St4/2  System Reset
Activating this input will hold the controller in a reset condition, i.e. all outputs &
displays are switched off and all other inputs are ignored (For test purpose only).

St4 / 3 & 4  End Limits
External limit switches can be connected Input at this terminal.

| ST 4 Pin 3 | = | end limit - |
| ST 4 Pin 4 | = | end limit + |

Error messages :
End limit – “active” = 02
End limit + “active” = 03

N.B If these are not connected to limit switches they need to be connected
Normally closed (i.e. linked out).

St4/5  Fixed Position
Activating this input starts the Axis to move to fixed position set in R25.

10. Functions of Outputs Terminals ST5 & 6

St5 pin 1-2  Position reached / in Position
The signal is a pulse of time set in R9. When R9 is set to zero, the output is
latched till next start is given. The output is set when:-
Actual value = Demand value +/-Tolerance window R12

St5 pin 3-10 Run signals
In the parameter R8/5 the logical combination of the output relays 2-5 for the
motion of the inverter ore the external relay logic can be selected. See pages 12/13
for the available combinations

St6 pin 1-2  Drive inhibit
At Start this output is activated. When position is reached, output is reset after a
time of R29.

St6 pin 3-4 Quantity reached
The output is a pulse of time set in R11, when quantity is reached.
For quantity subtracting – when quantity = 0
For quantity adding – when input value is reached.
For quantity add/sub – when 0 is reached on subtracting
10. Terminal Layout

Rear of the unit:

- **ST 9** Power supply
- **F1** Fuse 400mA

12. Installation Hints

Elgo Electric controllers are constructed to the latest standards of technology and protected against noise.

To enable the controller to operate successfully, the following instructions must be carried out.

Location: The unit must not be mounted in vicinity of high inductive or capacitive powers or static electricity.

Power Supply: For 230 VAC single phase supply, avoid using the same feed as to motors or contactors. Otherwise fit a Filter.

Cable: All low voltage cables must be run separately from power cables.

Screening: All external signal cables must be screened
1. Encoder cable
2. Input signal cable

All screens must be connected to a common earth point.

NB: Do not connect zero line to earth

Suppression: To avoid electronic noise. Suppress all coils in the cabinet and on Machine.

1. RC network for ac coils (e.g. 0.1 μF + 100 Ω)
2. Freewheel diode for dc coils
3. RC or similar suppressor for motor power lines and Brakes.
13. Only for Service

R99 Service Register

When R99 is selected, the following functions can be called up:-

Security Register R98 must be opened and service Register R90 set.

R90 = 000001 Button 0, 1 and 4 active
R90 = 000002 All buttons active

NB: Select R90 before R99

**Button 0** = Input test ST3

**Button 1** = Input test ST4

**Button 2** = Input/output test ST3 to ST5

**Button 4** = Displays the software details
   Demand window = SV number and version
   Quantity = SN number

**Button 5** = Selects relays 1-8 output test on ST5 and ST6

**Button 7** = Keyboard test

**Button 8** = Clear memory

**Button 9** = Load test programme

**Button “Select”** = Load default Register set

Liability exclusion / Guarantee

We have checked the contents of this instruction manual carefully, to the best of our knowledge and belief for conformity with the described hardware and software. Nevertheless errors, mistakes or deviations can not be excluded, therefore we do not guarantee complete conformity. Necessary corrections will be included in the subsequent editions. We appreciate your ideas and improvement suggestions very much. Reprint, duplication and translation, even in extracts, are only allowed with a written authorization by the company ELGO Electric GmbH. We constantly strive for improving our products, therefore we keep all rights reserved for any technical modifications without any notice.

ELGO Electric does not assume any liability for possible errors or mistakes.

The guarantee period is one calendar year from the date of delivery and includes the delivered unit with all components. ELGO Electric GmbH will at its option replace or repair without charge defects at the unit or the included parts, verifiable caused by faulty manufacturing and/or material in spite of proper handling and compliance to the instruction manual.

Damages verifiably not caused by ELGO Electric GmbH and due to improper handling are excluded from any guarantee e.g. by applying faulty voltage, diffusion of liquid into the interior of the engine, using force, scratching the surface, chemical influences etc.!

Subject to modifications © ELGO Electric GmbH 2004
